

SPRING PROJECTS

When the ground thaws, the real work begins. Winter leaves its mark – ruts, debris, and compacted soil. This step-by-step guide helps you restore, rebuild, and get your property ready for a productive spring.

Project 1: Debris & Storm Cleanup

Winter storms leave more behind than snow. Fallen limbs, brush piles, and windblown debris need to be cleared before they smother grass or slow new growth. Early cleanup sets the tone for the entire season.

Project 2: Driveway & Trail Restoration

Winter freeze-thaw cycles and runoff take a toll on gravel drives and access trails. Ruts, washouts, and displaced stone only get worse if left alone. Restore the grade, reestablish proper drainage, and bring your drive back to a smooth, controlled surface before traffic packs the damage in.

Project 3: Prepare Your Garden

Spring isn't just about turning soil – it's about preparing it properly. Break up compaction, incorporate organic matter, and level for a clean seedbed that supports strong germination. A well-prepared foundation now means healthier crops and fewer problems later.

Project 4: Pasture & Turf Management

After a long winter, your grass needs more than sunlight to recover. Remove thatch, relieve compaction, and ensure nutrients can reach the root zone. Proper pasture and turf management in early spring sets the stage for thick growth and sustained health all season.

Pro Tip for Homesteaders

Checking your 3-point hitch pins and greasing your zerks before you head into the field saves hours of frustration later. A well-maintained implement is a safe implement.
